Bartle - Introduction To Real Analysis - Chapter 6 Solutions

Bartle - Introduction To Real Analysis - Chapter 6

Solutions Section 6.2 Problem 6.2-4. Let $A = (a_1, a_2, \dots, a_n)$ be real numbers and let f be defined on \mathbb{R} by $f(x) = \sum_{i=1}^n (a_i - x)^2$. For $x \in \mathbb{R}$: Find the unique point of relative minimum for f . Solution: The first derivative of f is: $f'(x) = 2 \sum_{i=1}^n (a_i - x)$. Equating f' to zero, we find the relative extrema as follows: $f'(c) = 2 \sum_{i=1}^n (a_i - c) = 2 \left(\sum_{i=1}^n a_i - nc \right)$. Apr 1th, 2024

Bartle - Introduction To Real Analysis - Chapter 8 Solutions

Bartle - Introduction To Real Analysis - Chapter 8 Solutions Section 8.1 Problem 8.1-2. Show that $\lim_{n \rightarrow \infty} (1 + \frac{x}{n})^n = e^x$ for all $x \in \mathbb{R}$. Solution: For $x = 0$, we have $\lim_{n \rightarrow \infty} (1 + \frac{0}{n})^n = \lim_{n \rightarrow \infty} (1)^n = 1 = e^0$, so $f(0) = 1$. For $x \in \mathbb{R} \setminus \{0\}$, observe that $0 < \frac{x}{n} < 1$ for $n > x$.
